

Raphael Moreira

Software Engineer | Full-Stack Development | React, Node.js, PostgreSQL

NJ | raphaelmor711@gmail.com | linkedin.com/in/raphael-moreira20 | github.com/RaphaelM20 | [Portfolio](#)

SUMMARY

Software engineer who builds full-stack web applications in React, Node.js, and PostgreSQL, from data model to deployed product. Brings 2 years of production experience on a 3PL warehouse management system, writing SQL against live databases, automating workflows in Python, and debugging failing API integrations to root cause. Uses AI tools like Claude Code to ship faster, while reviewing and testing every change.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Python, SQL, HTML, CSS

Frontend: React, Vite, Three.js, Responsive Design

Backend: Node.js, Express, REST APIs, WebSockets, Prisma ORM, JWT, Passport.js, bcrypt

Databases: PostgreSQL, MySQL, MongoDB

Tools & Testing: Git, GitHub, Docker, Postman, Vitest, Jira, Netlify, Render, Neon

AI Tools: Claude Code, Gemini Code Assist, GitHub Copilot, AI-Assisted Debugging

EXPERIENCE

Independent Software Developer

Apr. 2026 – Present

Self-Directed

Remote

- Shipped 3 deployed full-stack applications in React, Node.js, Express, and PostgreSQL, building end-to-end from relational data model to production hosting on Netlify, Render, and Neon.
- Implemented secure authentication across all 3 apps using JWT, bcrypt password hashing, and Passport.js, with server-side validation on every protected route.
- Accelerated build and debug cycles by roughly 40% using Claude Code and Gemini Code Assist for code review, test generation, and dependency tracing.

WMS Support Specialist

May 2024 – Mar. 2026

Bergen Logistics

North Bergen, NJ

- Debugged 20+ failing client API integrations by replicating requests in Postman, isolating the cause of inventory quantity mismatches, and restoring accurate data sync.
- Cut report turnaround by 60% across 10+ client accounts by writing Python automation scripts that replaced recurring manual data entry.
- Wrote 15+ custom SQL queries and reports against the production WMS database, giving executive teams reliable inventory and performance data.
- Restored a failed USPS SFTP upload pipeline by diagnosing and repairing the scheduled Windows Task Scheduler job that ran it.
- Resolved 25+ production issues per week across receiving, inventory, and shipping modules in Jira, and cut repeat incidents by 30% by documenting root causes and fixes for the IT team.

PROJECTS

Car Soccer | [TypeScript](#), [Three.js](#), [React](#), [WebSockets](#), [Vitest](#) | [GitHub](#)

Sep. 2026

- Built a browser car-soccer game with a custom deterministic physics simulation in TypeScript, running on a fixed 120 Hz timestep and validated against reference values for speed, acceleration, and jump height.
- Added online 1v1 multiplayer with host-authoritative netcode, client-side prediction with smooth correction, and a WebSocket relay server that matches players by room code.
- Wrote 136 Vitest tests covering physics, netcode, and frame-rate independence, and kept a 16,000-fan instanced stadium rendering above 60 fps.

Chirp | [React](#), [Node.js](#), [Express](#), [PostgreSQL](#), [Prisma](#) | [GitHub](#)

Jun. 2026

- Built a Twitter/X clone with JWT authentication, posts, likes, comments, and a follow system, deployed as a separate React frontend and Express REST API.
- Loaded user feeds with zero N+1 database calls by designing a self-referential PostgreSQL follow model in Prisma.

Find It | [React](#), [Node.js](#), [Express](#), [PostgreSQL](#), [Prisma](#) | [GitHub](#)

Apr. 2026

- Built a server-authoritative photo-tagging game where hit detection, progress, and timing all run on the server, so no character coordinates reach the browser and scores can't be forged from the client.

EDUCATION

New Jersey Institute of Technology

Newark, NJ

Bachelor of Engineering Technology in Computer Technology

Sep. 2020 – Dec. 2024

- Relevant Coursework: Data Structures, Database Design, Web Application Development, Systems Analysis, Networking
